```
Algebraic varieties, stacks, sheaves, schemes, moduli spaces, complex geometry, quantum cohomology
                                                                                                                                                                math AG - Algebraic Geometry
                                                                                                                                                                 math.AT - Algebraic Topology
                                                                                 Homotopy theory, homological algebra, algebraic treatments of manifolds
                                                Existence and uniqueness, boundary conditions, linear and non-linear operators, stability, soliton theory,
                                                                                                                                                                    math.AP - Analysis of PDEs
                                                integrable PDE's, conservation laws, qualitative dynamics
                                                                                                                                                                   math.CT - Category Theory
                                                                    Enriched categories, topoi, abelian categories, monoidal categories, homological algebra
                                   Special \ functions, \ or thogonal \ polynomials, \ harmonic \ analysis, \ ODE's, \ differential \ relations, \ calculus \ of
                                                                                                                                                       math.CA - Classical Analysis and ODEs
                                                  Discrete mathematics, graph theory, enumeration, combinatorial optimization, Ramsey theory, combinatorial
                                                                                                                                                                      math CO - Combinatorics
                                           Commutative rings, modules, ideals, homological algebra, computational aspects, invariant theory,
                                                                                                                                                               math.AC - Commutative Algebra
                                           connections to algebraic geometry and combinatorics
                                              Holomorphic functions, automorphic group actions and forms, pseudoconvexity, complex geometry, analytic
                                                                                                                                                                  math.CV - Complex Variables
                                            Complex, contact, Riemannian, pseudo-Riemannian and Finsler geometry, relativity, gauge theory, global
                                                                                                                                                                math.DG - Differential Geometry
                                            Dynamics of differential equations and flows, mechanics, classical few-body problems, iterations, complex
                                                                                                                                                                 math.DS - Dynamical Systems
                                            dynamics, delayed differential equations
                                                Banach spaces, function spaces, real functions, integral transforms, theory of distributions, measure theory
                                                                                                                                                                 math.FA - Functional Analysis
                                                                                                                                                               math.GM - General Mathematics
                                                                                 Mathematical material of general interest, topics not covered elsewhere
                                               Continuum theory, point-set topology, spaces with algebraic structure, foundations, dimension theory, local
                                                                                                                                                                  math.GN - General Topology
                                              and global properties
                                                                           Manifolds, orbifolds, polyhedra, cell complexes, foliations, geometric structures
                                                                                                                                                                math.GT - Geometric Topology
                                                               Finite groups, topological groups, representation theory, cohomology, classification and structure
                                                                                                                                                                       math.GR - Group Theor
                                            Biographies, philosophy of mathematics, mathematics education, recreational mathematics, communication
                                                                                                                                                                math.HO - History and Overview
                                                                                                                                                                                                     Mathematics
                                           of mathematics
                                                                                                                                                                                                     (math)
                                                                                                                                                                   math.IT - Information Theory
                                                   math.IT is an alias for cs.IT. Covers theoretical and experimental aspects of information theory and coding.
                                                                                                                                                             math.KT - K-Theory and Homology
                                               Algebraic and topological K-theory, relations with topology, commutative algebra, and operator algebras
                                                                                                                                                                              math LO - Logic
                                                                                                                Logic, set theory, point-set topology, formal mathematics
                                           Mathematical methods in quantum field theory, quantum mechanics, statistical mechanics, condensed
                                                                                                                                                               math MP - Mathematical Physics
                                                Euclidean, hyperbolic, discrete, convex, coarse geometry, comparisons in Riemannian geometry, symmetric
                                                                                                                                                                     math.MG - Metric Geometry
                                                 Prime numbers, diophantine equations, analytic number theory, algebraic number theory, arithmetic
                                                                                                                                                                     math.NT - Number Theory
                                                 geometry, Galois theory
                                                                                                                                                                 math.NA - Numerical Analysis
                                                                        Numerical algorithms for problems in analysis and algebra, scientific computation
                                                  _Algebras of operators on Hilbert space, C^*-algebras, von Neumann algebras, non-commutative geometry
                                                                                                                                                                  math.OA - Operator Algebras
                                                                                                                                                            math.OC - Optimization and Control
                                               _Operations research, linear programming, control theory, systems theory, optimal control, game theory
                                                      Theory and applications of probability and stochastic processes: e.g. central limit theorems, large deviations
                                                                                                                                                                          math.PR - Probability
                                                     stochastic differential equations, models from statistical mechanics, queuing theory
                                                                  Quantum groups, skein theories, operadic and diagrammatic algebra, quantum field theory
                                                                                                                                                                   math.QA - Quantum Algebra
                                                                                                                                                              math.RT - Representation Theory
                                                   Linear representations of algebras and groups, Lie theory, associative algebras, multilinear algebra
                                             Non-commutative rings and algebras, non-associative algebras, universal algebra and lattice theory, linear
                                                                                                                                                                 math RA - Rings and Algebras
                                             algebra, semigroups
                                                  Schrodinger operators, operators on manifolds, general differential operators, numerical studies, integral
                                                                                                                                                                     math.SP - Spectral Theory
                                                 operators, discrete models, resonances, non-self-adjoint operators, random operators/matrices
                                                math.ST is an alias for stat.TH. Applied, computational and theoretical statistics: e.g. statistical inference,
                                                 regression, time series, multivariate analysis, data analysis, Markov chain Monte Carlo, design of
                                                                                                                                                                    math.ST - Statistics Theory
                                                experiments, case studies
                                                                                    Hamiltonian systems, symplectic flows, classical integrable systems
                                                                                                                                                                math.SG - Symplectic Geometry
                                            DNA, RNA, proteins, lipids, etc.; molecular structures and folding kinetics; molecular interactions;
                                                                                                                                                                q-bio.BM - Biomolecules
                                            \textbf{Cell-cell signaling and interaction; morphogenesis and development; apoptosis; bacterial conjugation;}\\
                                                                                                                                                                q-bio.CB - Cell Behavior
                                               DNA sequencing and assembly; gene and motif finding; RNA editing and alternative splicing; genomic
                                                                                                                                                                  q-bio.GN - Genomics
                                               structure and processes (replication, transcription, methylation, etc); mutational processes.
                                                                                                                                                         q-bio.MN - Molecular Networks
                                                   Gene regulation, signal transduction, proteomics, metabolomics, gene and enzymatic networks
                                                                                                                                                                                             Quantitative Biology
                                                                                                                                                     q-bio.NC - Neurons and Cognition
                                                  Synapse, cortex, neuronal dynamics, neural network, sensorimotor control, behavior, attention
                                                                Work in quantitative biology that does not fit into the other q-bio classifications
                                                                                                                                                    q-bio.OT - Other Quantitative Biology
                                Population dynamics, spatio-temporal and epidemiological models, dynamic speciation, co-evolution,
                                                                                                                                                    q-bio.PE - Populations and Evolution
                               biodiversity, foodwebs, aging; molecular evolution and phylogeny; directed evolution; origin of life
                                                         All experimental, numerical, statistical and mathematical contributions of value to biology
                                                                                                                                                        q-bio.QM - Quantitative Methods
                                   Assembly and control of subcellular structures (channels, organelles, cytoskeletons, capsules, etc.);
                                                                                                                                                       q-bio.SC - Subcellular Processes
                                  molecular motors, transport, subcellular localization; mitosis and meiosis
                                                                                                                                                        q-bio.TO - Tissues and Organs
                                                  Blood flow in vessels, biomechanics of bones, electrical waves, endocrine system, tumor growth
                                                                                                              cond-mat.dis-nn - Disordered Systems and Neural Networks
                   Techniques, synthesis, characterization, structure. Structural phase transitions, mechanical properties,
                                                                                                                                       cond-mat.mtrl-sci - Materials Science
                  phonons. Defects, adsorbates, interfaces
Semiconducting nanostructures: quantum dots, wires, and wells. Single electronics, spintronics, 2d electron
                                                                                                                    cond-mat.mes-hall - Mesoscale and Nanoscale Physics
gases, quantum Hall effect, nanotubes, graphene, plasmonic nanostructures
                                           Work in condensed matter that does not fit into the other cond-mat classifications
                                                                                                                                  cond-mat.other - Other Condensed Matter
                 Ultracold atomic and molecular gases, Bose-Einstein condensation, Feshbach resonances, spinor
                                                                                                                                                                                  Condensed Matter
                 condensates, optical lattices, quantum simulation with cold atoms and molecules, macroscopic interference
                                                                                                                                                                                                                       arXiv
                                                                                                                                     cond-mat.quant-gas - Quantum Gases
                 _phenomena
                                                       Membranes, polymers, liquid crystals, glasses, colloids, granular matter
                                                                                                                                     cond-mat.soft - Soft Condensed Matter
             Phase transitions, thermodynamics, field theory, non-equilibrium phenomena, renormalization group and
                                                                                                                                 cond-mat.stat-mech - Statistical Mechanics
             scaling, integrable models, turbulence
          Quantum magnetism, non-Fermi liquids, spin liquids, quantum criticality, charge density waves,
         metal-insulator transitions
                                                            Superconductivity: theory, models, experiment. Superflow in helium
                                                                                                                                     cond-mat.supr-con - Superconductivity
                        Phenomena pertaining to galaxies or the Milky Way. Star clusters, galactic nebulae, the interstellar medium,
                        clouds, dust. Galactic structure, formation, dynamics. Galactic nuclei, bulges, disks, halo. Active Galactic
                                                                                                                                           astro-ph.GA - Astrophysics of Galaxies
                        Nuclei, supermassive black holes, quasars. Gravitational lens systems. The Milky Way and its contents
      Phenomenology of early universe, cosmic microwave background, cosmological parameters, primordial
      element abundances, extragalactic distance scale, large-scale structure of the universe. Groups,
      superclusters, voids, intergalactic medium. Particle astrophysics: dark energy, dark matter, baryogenesis,
                                                                                                                          astro-ph.CO - Cosmology and Nongalactic Astrophysics
      leptogenesis, inflationary models, reheating, monopoles, WIMPs, cosmic strings, primordial black holes,
      cosmological gravitational radiation
               Interplanetary medium, planetary physics, planetary astrobiology, extrasolar planets, comets, asteroids,
                                                                                                                                   astro-ph.EP - Earth and Planetary Astrophysics
                                                                                                                                                                                       Astrophysics
                                                                                                                                                                                       (astro-ph)
         Cosmic ray production, acceleration, propagation, detection. Gamma ray astronomy and bursts, X-rays,
         charged particles, supernovae and other explosive phenomena, stellar remnants and accretion systems, jets,
                                                                                                                             astro-ph.HE - High Energy Astrophysical Phenomena
        microquasars, neutron stars, pulsars, black holes
   Detector and telescope design, experiment proposals. Laboratory Astrophysics. Methods for data analysis,
                                                                                                                       astro-ph.IM - Instrumentation and Methods for Astrophysics
  statistical methods. Software, database design
                  White dwarfs, brown dwarfs, cataclysmic variables. Star formation and protostellar systems, stellar
                  astrobiology, binary and multiple systems of stars, stellar evolution and structure, populations, coronas
                                                                                                                                      astro-ph.SR - Solar and Stellar Astrophysics
                  Stellar and planetary nebulae, helioseismology, solar neutrinos, production and detection of gravitational
                 radiation from stellar systems
                                                                                                                                                        General Relativity and Quantum Cosmology
                                                                                                                                                       (gr-qc)
                                                                                                                                                                  High Energy Physics - Experiment
                                                                                                                                                                 (hep-ex)
                                                                                                                                                                       High Energy Physics - Lattice
